

# Introduction to Reinforcement Learning

Prof. Chia-Yu Lin
Yuan Ze University
2022 Spring

### Supervised Learning → RL

It is challenging to label data in some tasks.

..... machine can know the results are good or not.

#### Outline

What is RL? (Three steps in ML)

Policy Gradient

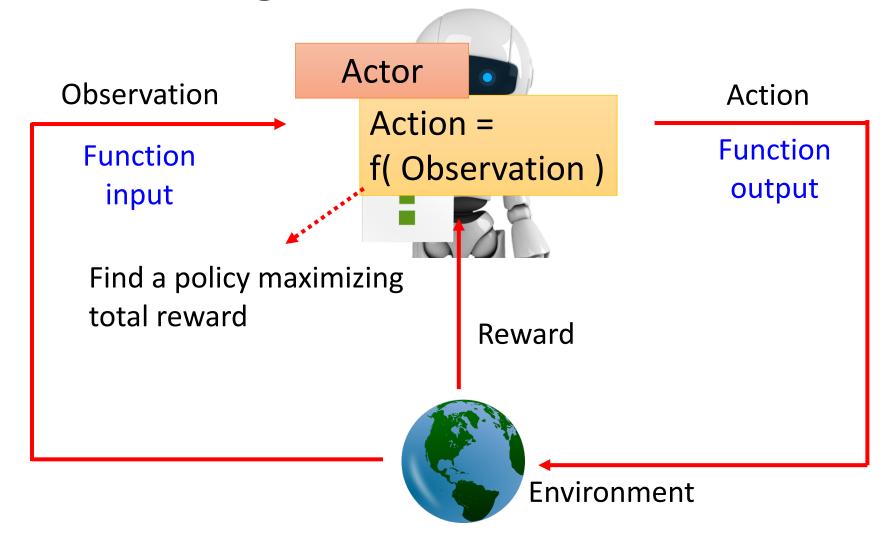

**Actor-Critic** 

**Reward Shaping** 

No Reward: Learning from Demonstration

## Machine Learning ≈ Looking for a Function

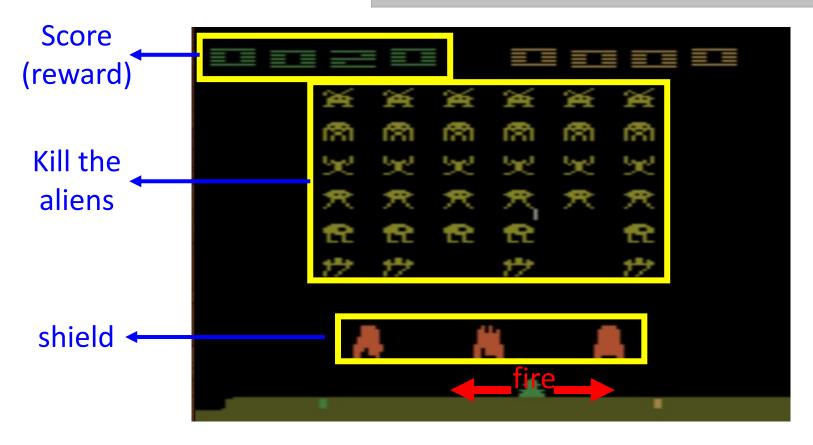

### Example: Playing Video Game

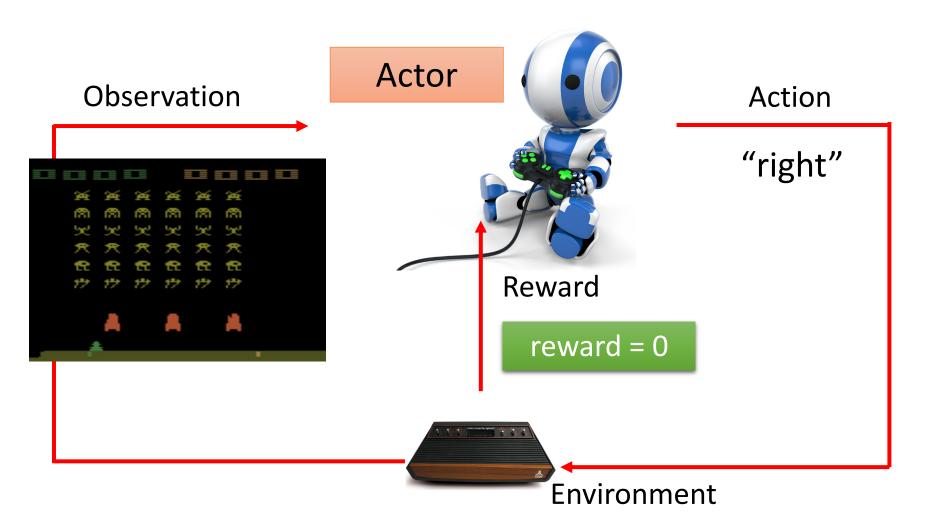

Space invader

Termination: all the aliens are killed, or your spaceship is destroyed.

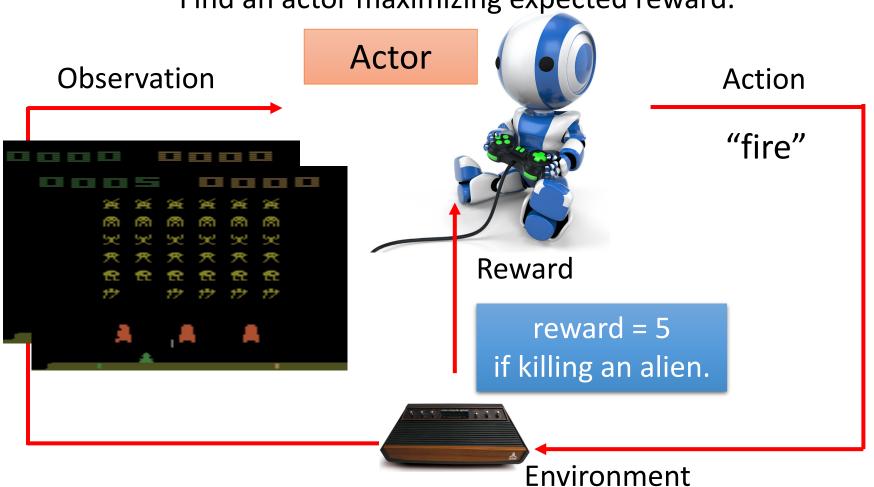

### Example: Playing Video Game

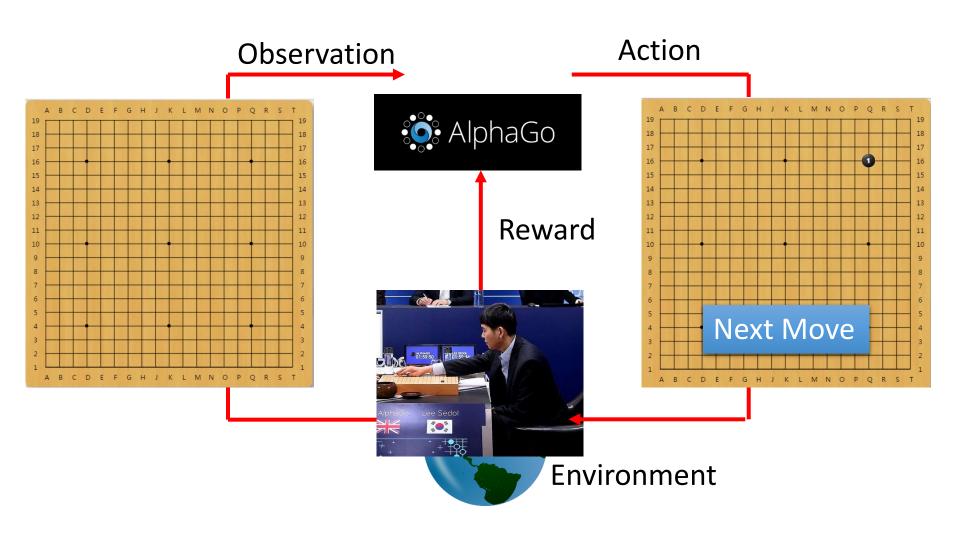

### Example: Playing Video Game

Find an actor maximizing expected reward.

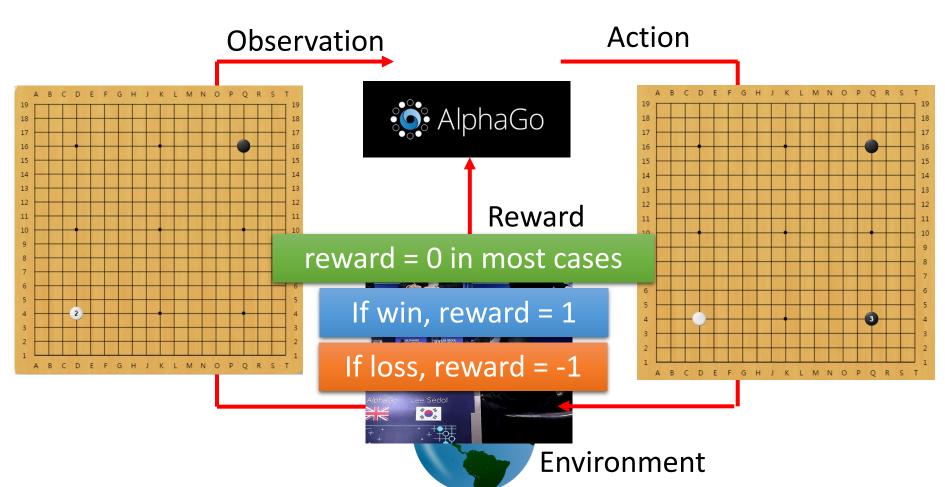

### Example: Learning to play Go

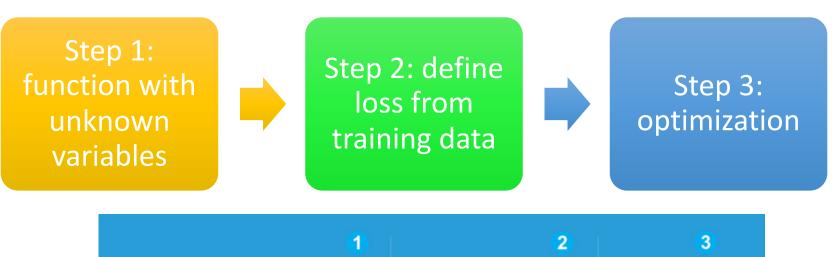

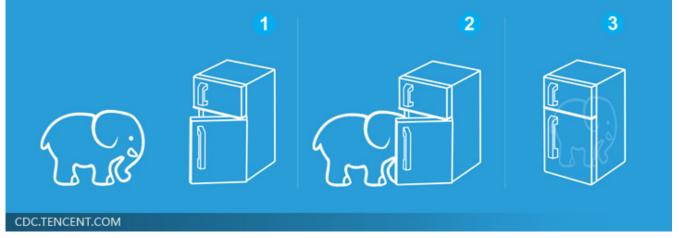

### Example: Learning to play Go

Find an actor maximizing expected reward.

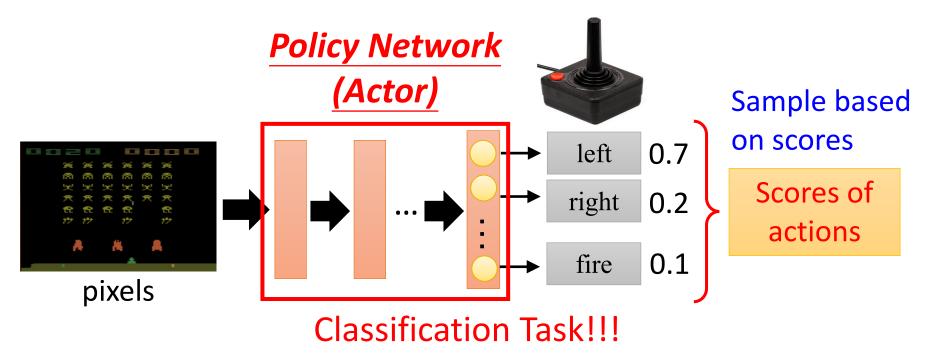

### Machine Learning is so simple .....

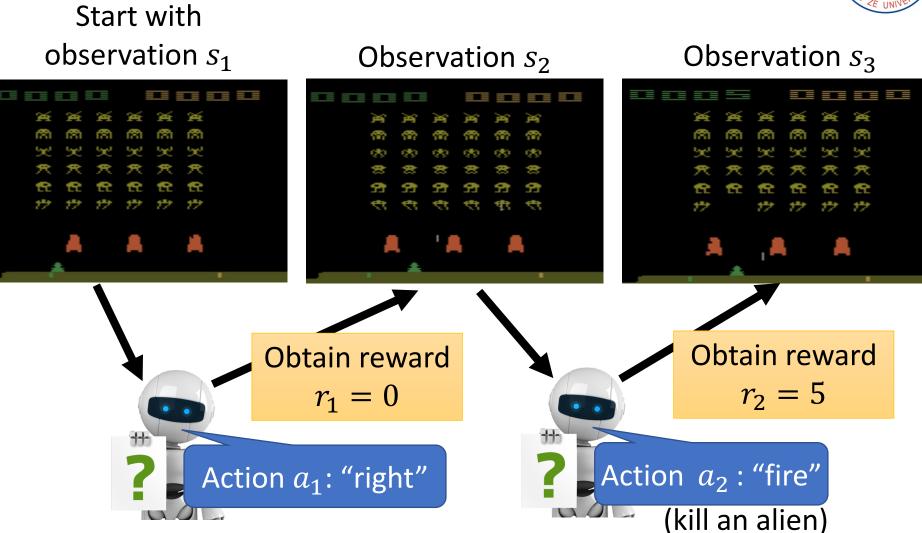

### Step 1: Function with Unknown

- Input of neural network: the observation of machine represented as a vector or a matrix
- Output neural network : each action corresponds to a neuron in output layer

#### Step 2: Define "Loss"

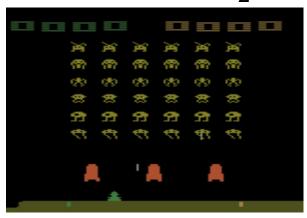

#### Step 2: Define "Loss"

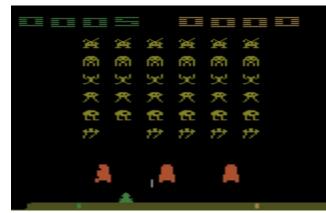

Start with observation  $s_1$ 

Observation  $s_2$ 

Observation  $s_3$ 

After many turns

Action  $a_T$ 

Game Over (spaceship destroyed)

Obtain reward  $r_T$ 

This is an episode.

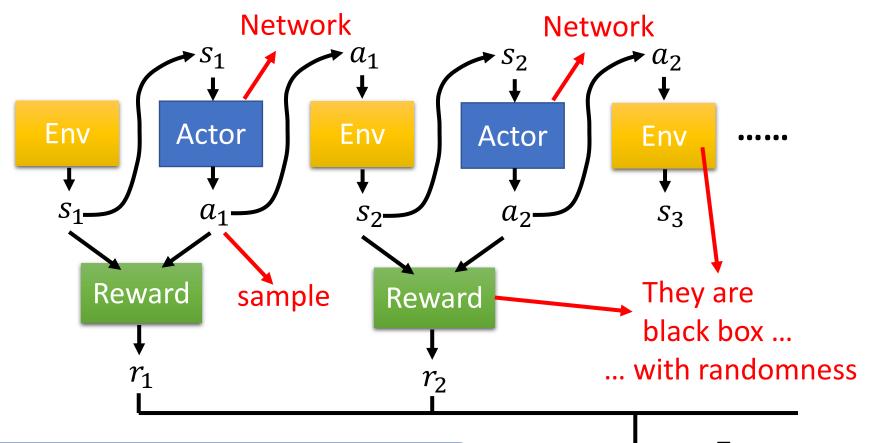

Total reward (return):  $R = \sum_{n=0}^{T} \frac{1}{n!}$ 

What we want to maximize

### Step 3: Optimization

#### Trajectory

$$\tau = \{s_1, a_1, s_2, a_2, \dots\}$$

How to do the optimization here is the main challenge in RL.

$$R(\tau) = \sum_{t=1}^{T} r_t$$

#### Outline

To learn more about policy gradient: https://youtu.be/W8XF3ME8G2I

What is RL? (Three steps in ML)

**Policy Gradient** 

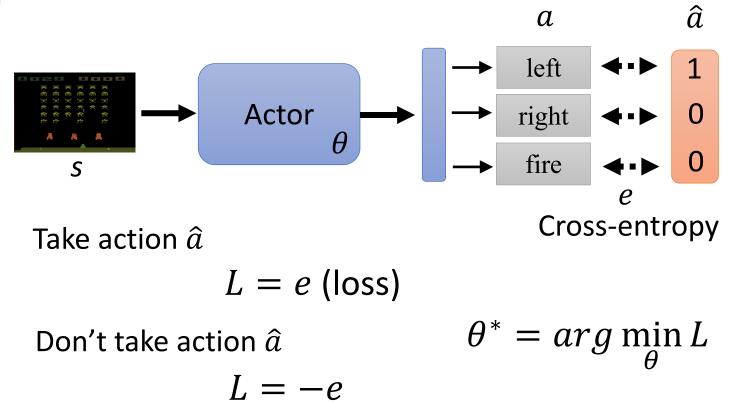

**Actor-Critic** 

**Reward Shaping** 

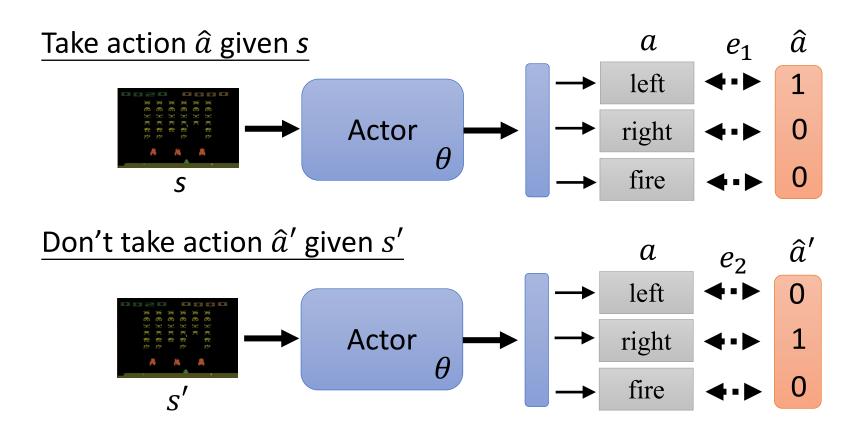

No Reward: Learning from Demonstration

• Make it take (or don't take) a specific action  $\hat{a}$  given specific observation s.

$$L = e_1 - e_2 \qquad \theta^* = \arg\min_{\theta} L$$

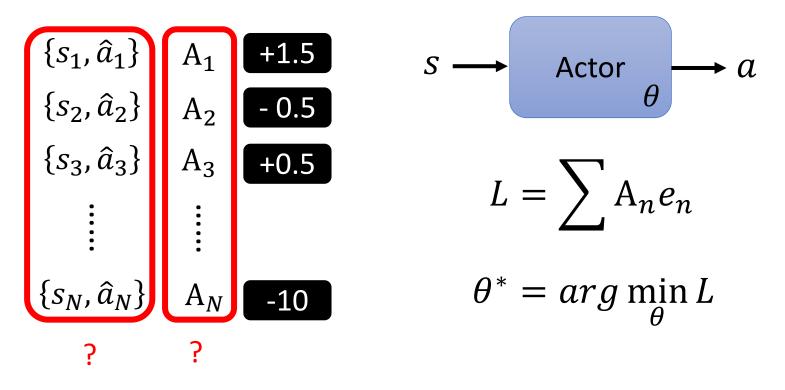

#### **Training Data**

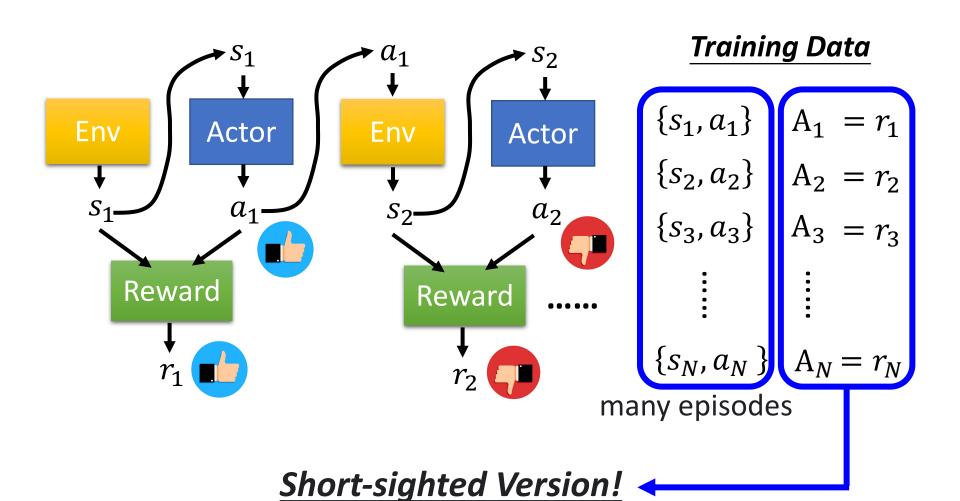

$$\begin{cases} s_1, \hat{a}_1 \rbrace & +1 & \text{Yes} \\ \{s_2, \hat{a}_2 \rbrace & -1 & \text{No} \end{cases}$$
 
$$\begin{cases} s_3, \hat{a}_3 \rbrace & +1 & \text{Yes} \\ \vdots & \vdots \\ \{s_N, \hat{a}_N \rbrace & -1 & \text{No} \end{cases}$$
 
$$L = +e_1 - e_2 + e_3 \cdots - e_N$$
 
$$\theta^* = arg \min_{\theta} L$$

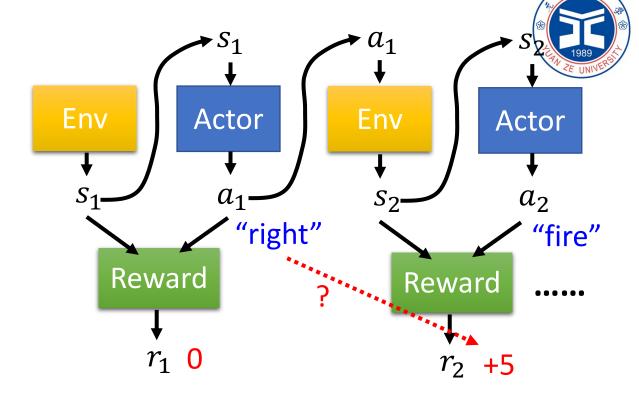

#### **Training Data**

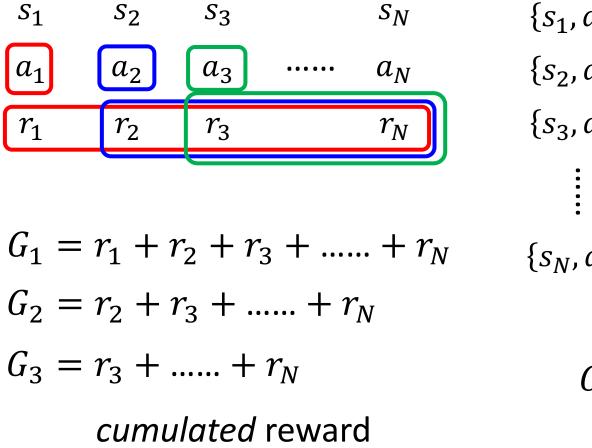

- An action affects the subsequent observations and thus subsequent rewards.
- Reward delay: Actor has to sacrifice immediate reward to gain more long-term reward.
- In space invader, only "fire" yields positive reward, so vision
   0 will learn an actor that always "fire".

#### **Training Data**

$$\{s_{1}, a_{1}\}$$
  $A_{1} = G_{1}$   
 $\{s_{2}, a_{2}\}$   $A_{2} = G_{2}$   
 $\{s_{3}, a_{3}\}$   $A_{3} = G_{3}$   
 $\vdots$   $\vdots$   
 $\{s_{N}, a_{N}\}$   $A_{N} = G_{N}$ 

#### **Training Data**

Also the credit of  $a_1$ ?

$$G_1 = r_1 + r_2 + r_3 + \dots + r_N$$

$$G_1' = r_1 + \gamma r_2 + \gamma^2 r_3 + \dots$$

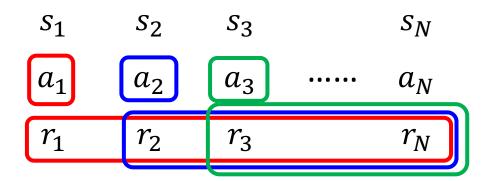

Discount factor  $\gamma < 1$ 

This is called "discounted cumulated reward."

$$\{s_1, a_1\}$$
  $A_1 = G'_1$   
 $\{s_2, a_2\}$   $A_2 = G'_2$   
 $\{s_3, a_3\}$   $A_3 = G'_3$   
 $\vdots$   $\vdots$   
 $\{s_N, a_N\}$   $A_N = G'_N$ 

$$G_t' = \sum_{n=t}^N \gamma^{n-t} r_n$$

Good or bad reward is "relative"

If all the  $r_n \ge 10$ 

 $r_n = 10$  is negative ...

Minus by a baseline b

Make  $G'_t$  have positive and negative values

#### **Training Data**

$$\{s_1, a_1\}$$
  $A_1 = G'_1 - b$   
 $\{s_2, a_2\}$   $A_2 = G'_2 - b$   
 $\{s_3, a_3\}$   $A_3 = G'_3 - b$   
 $\vdots$   $\vdots$   
 $\{s_N, a_N\}$   $A_N = G'_N - b$ 

$$G_t' = \sum_{n=t}^N \gamma^{n-t} r_n$$

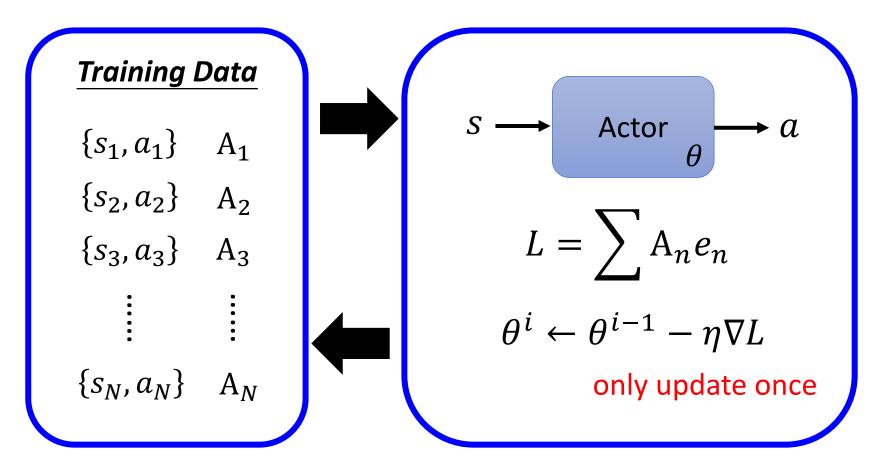

- Initialize actor network parameters  $\theta^0$
- For training iteration i = 1 to T

  - Using actor  $\theta^{i-1}$  to interact Obtain data  $\{s_1,a_1\},\{s_2,a_2\},\dots,\{s_N,a_N\}$  Compute  $A_1,A_2,\dots,A_N$

  - Compute loss *L*
  - $\theta^i \leftarrow \theta^{i-1} n\nabla L$

Data collection is in the "for loop" of training iterations.

Each time you update the model parameters, you need to collect the whole training set again.

- Initialize actor network parameters  $\theta^0$
- For training iteration i = 1 to T
  - ullet Using actor  $heta^{i-1}$  to interact

Experience of  $\theta^{i-1}$ 

- Obtain data  $\{s_1, a_1\}, \{s_2, a_2\}, \dots, \{s_N, a_N\}$
- Compute  $A_1, A_2, \ldots, A_N$
- Compute loss L

$$\bullet \underbrace{\theta^i}_{} \leftarrow \underbrace{\theta^{i-1}}_{} - \eta \nabla L$$

May not be good for  $\theta^i$ 

### 棋魂第八集

表 小馬步飛: 提將棋一樣,將棋子放在斜一格: 大馬步飛則是放在斜好幾格。

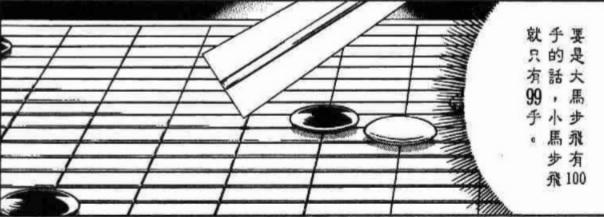

### 棋魂第八集

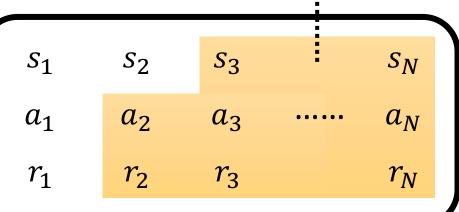

- Initialize actor network parameters  $heta^0$
- For training iteration i = 1 to T
  - Using actor  $\theta^{i-1}$  to interact
  - Obtain data  $\{s_1, a_1\}, \{s_2, a_2\}, \dots, \{s_N, a_N\}$
  - Compute  $A_1, A_2, \ldots, A_N$
  - Compute loss L
  - $\theta^i \leftarrow \theta^{i-1} \eta \nabla L$

Trajectory of  $\theta^{i-1}$ 

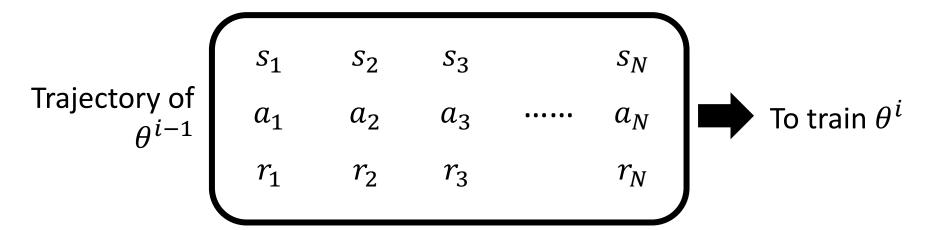

May not observe by  $\theta^i$ 

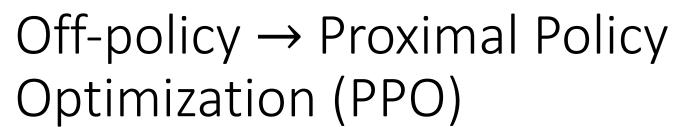

### On-policy v.s. Off-policy

- The actor to train and the actor for interacting is the same. → On-policy
- Can the actor to train and the actor for interacting be different? → Off-policy

In this way, we do not have to collection data after each update.

 The actor to train has to know its difference from the actor to interact.

video:

https://youtu.be/OAKAZhFmYoI

Not apply to everyone

the actor to train

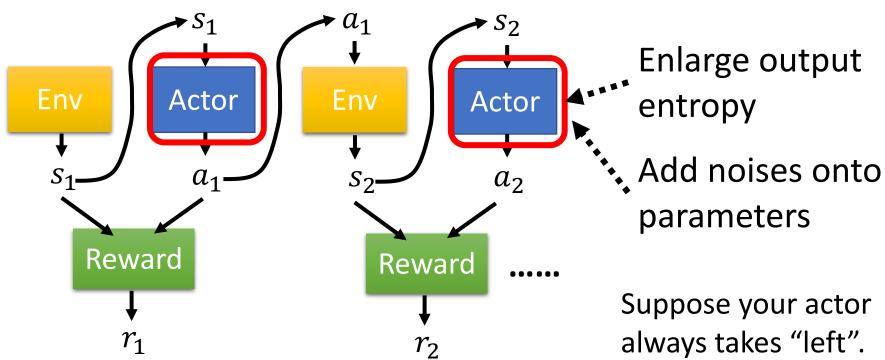

the actor to interact

https://disp.cc/b/115-bLHe

The actor needs to have randomness during data collection.

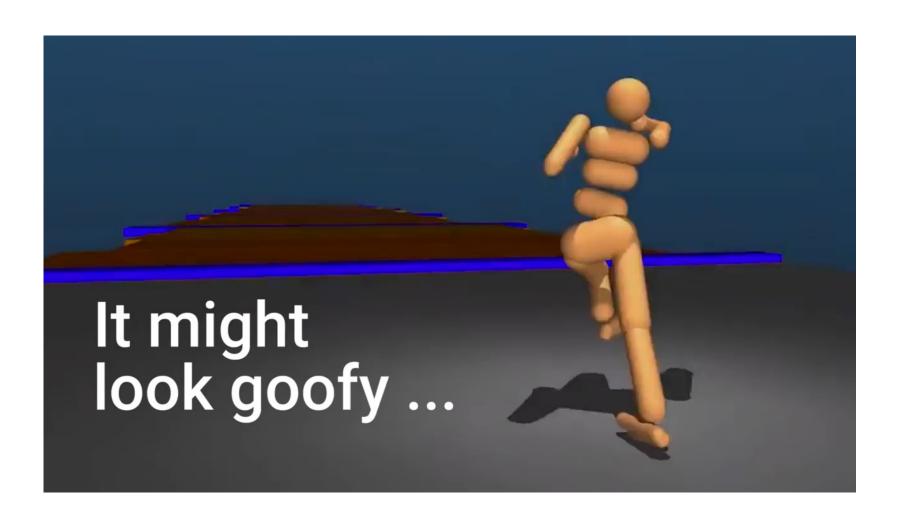

A major reason why we sample actions. ©

Suppose your actor always takes "left".

We never know what would happen if taking "fire".

#### Outline

What is RL? (Three steps in ML)

Policy Gradient

**Actor-Critic** 

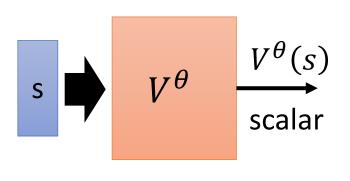

**Reward Shaping** 

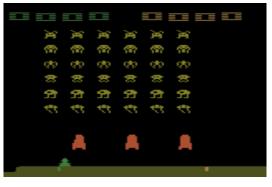

No Reward: Learning from Demonstration

#### Critic

$$G_1' = r_1 + \gamma r_2 + \gamma^2 r_3 + \dots$$

- Critic: Given actor  $\theta$ , how good it is when observing s (and taking action a) \_
- Value function  $V^{\theta}(s)$ : When using actor  $\theta$ , the discounted cumulated reward expects to be obtained after seeing s

 $V^{\theta}(s)$  is large

 $V^{\theta}(s)$  is smaller

The output values of a critic depend on the actor evaluated.

# How to estimate $V^{\theta}(s)$

#### Monte-Carlo (MC) based approach

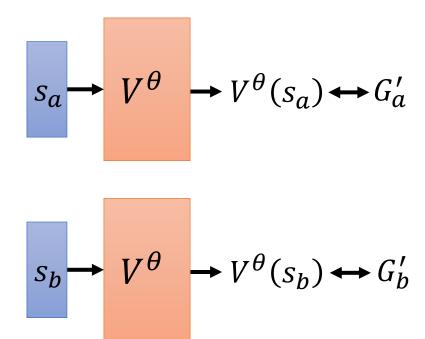

The critic watches actor  $\theta$  to interact with the environment.

After seeing  $s_a$ ,

Until the end of the episode, the discounted cumulated reward is  $G'_a$ 

After seeing  $s_b$ ,

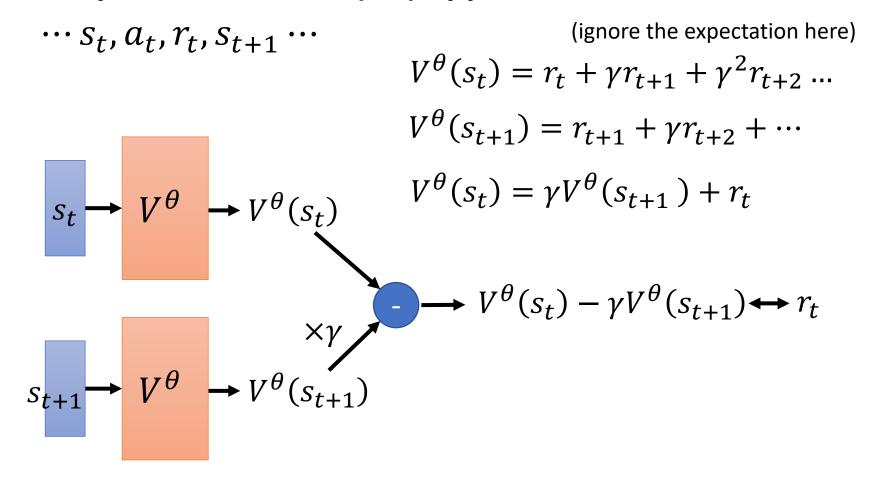

Until the end of the episode, the discounted cumulated reward is  $G_b'$ 

### How to estimate $V^{\pi}(s)$

#### Temporal-difference (TD) approach

### MC v.s. TD

The critic has observed the following 8 episodes

• 
$$s_a, r = 0, s_b, r = 0$$
, END

• 
$$s_b, r = 1$$
, END

• 
$$s_h, r = 1$$
, END

• 
$$s_b, r = 1$$
, END

• 
$$s_h, r = 1$$
, END

• 
$$s_h, r = 1$$
, END

• 
$$s_b, r = 1$$
, END

• 
$$s_h, r = 0$$
, END

(Assume  $\gamma = 1$ , and the actions are ignored here.)

$$V^{\theta}(s_b) = 3/4$$

$$V^{\theta}(s_a) = ? 0? 3/4?$$

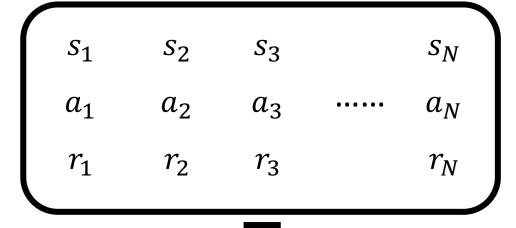

Monte-Carlo: 
$$V^{\theta}(s_a) = 0$$

Temporal-difference:

$$V^{\theta}(s_a) = V^{\theta}(s_b) + r$$
  
3/4 3/4 0

### Version 3.5

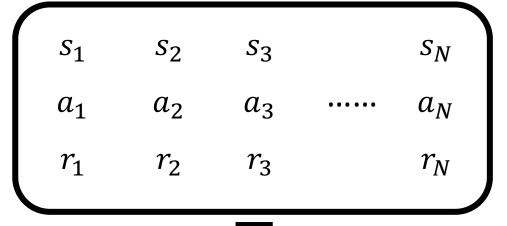

#### **Training Data**

$$\{s_1, a_1\}$$
  $A_1 = G'_1 - b$   
 $\{s_2, a_2\}$   $A_2 = G'_2 - b$   
 $\{s_3, a_3\}$   $A_3 = G'_3 - b$   
 $\vdots$   $\vdots$   
 $\{s_N, a_N\}$   $A_N = G'_N - b$ 

#### Version 3.5

#### **Training Data**

$$\{s_1, a_1\}$$
  $A_1 = G_1' - V^{\theta}(s_1)$ 

$$\{s_2, a_2\}$$
  $A_2 = G_2' - V^{\theta}(s_2)$ 

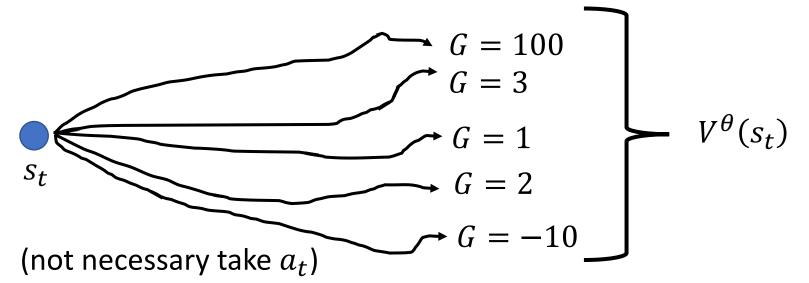

$$\{s_3, a_3\}$$
  $A_3 = G_3' - V^{\theta}(s_3)$ 

$$\{s_N, a_N\}$$
  $A_N = G'_N - V^{\theta}(s_N)$ 

### Version 3.5

$$\{s_t, a_t\}$$
  $A_t = G'_t - V^{\theta}(s_t)$ 

(You sample the actions based on a distribution)

$$\begin{array}{c}
a_t \\
S_t
\end{array}$$

Just a sample

$$A_t > 0$$

 $a_t$  is better than average.

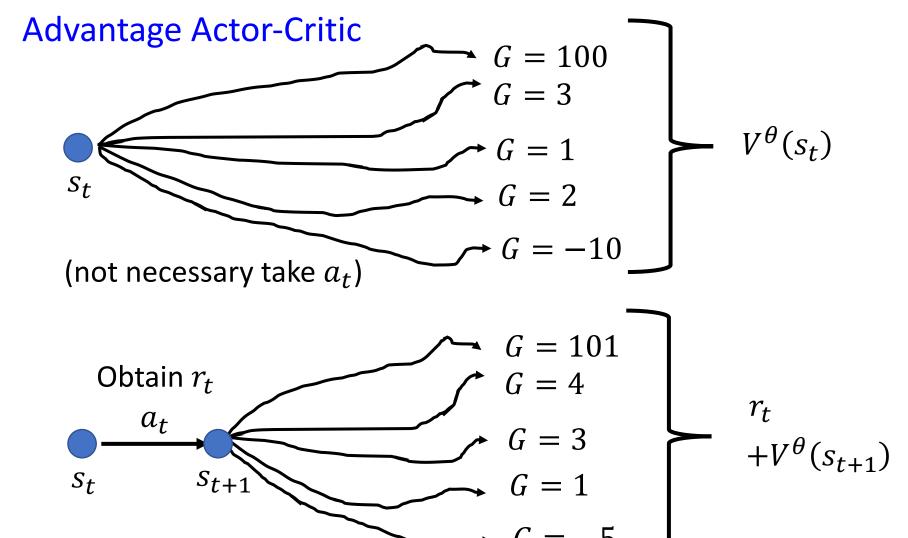

$$A_t < 0$$

 $a_t$  is worse than average.

$$r_t + V^{\theta}(s_{t+1}) - V^{\theta}$$

### Version 4

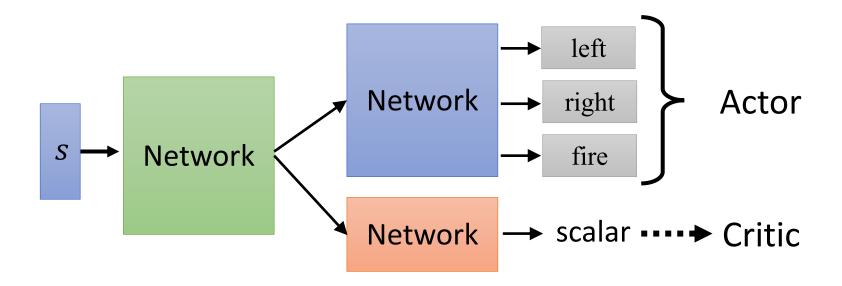

$$\{s_t, a_t\}$$
  $A_t = G'_t - V^{\theta}(s_t)$ 

### Tip of Actor-Critic

• The parameters of actor and critic can be shared.

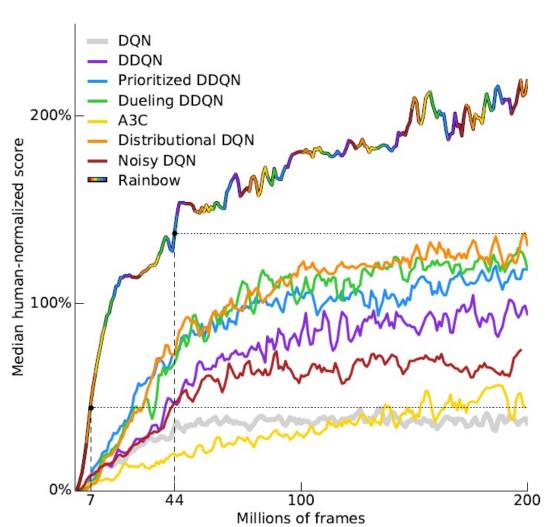

# Outlook: Deep Q Network (DQN)

#### Outline

What is RL? (Three steps in ML)

Policy Gradient

**Actor-Critic** 

**Reward Shaping** 

No Reward: Learning from Demonstration

### Sparse Reward

$$A_t = r_t + V^{\theta}(s_{t+1}) - V^{\theta}(s_t)$$

#### 

#### **Training Data**

$$\{s_1, a_1\}$$
  $A_1$   
 $\{s_2, a_2\}$   $A_2$   
 $\{s_3, a_3\}$   $A_3$   
 $\vdots$   $\vdots$   
 $\{s_N, a_N\}$   $A_N$ 

If  $r_t = 0$  in most cases

We don't know actions are good or bad.

e.g., robot arm to bolt on the screws

The developers define extra rewards to guide agents.

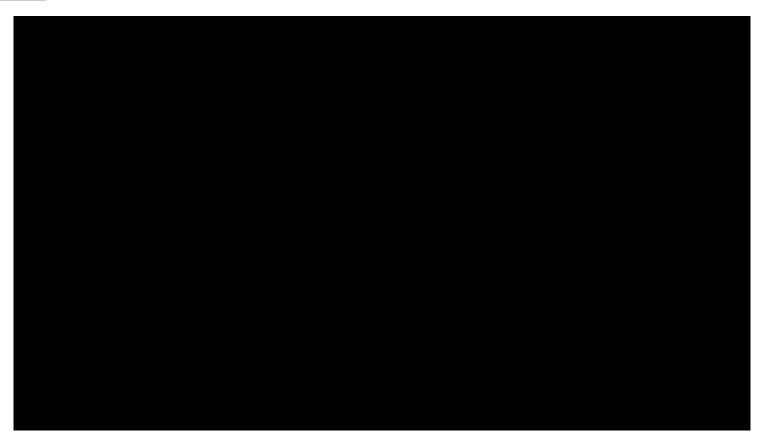

reward shaping

### Reward Shaping

**VizDoom** https://openreview.net/forum?id=Hk3mPK5gg&noteId=Hk3mPK5gg

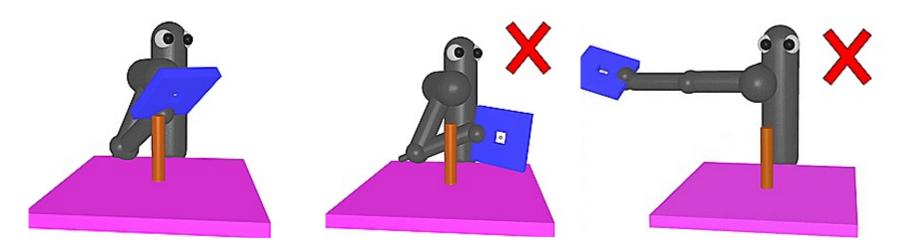

Visual Doom AI Competition @ CIG 2016 https://www.youtube.com/watch?v=94EPSjQH38Y

### Reward Shaping

**VizDoom** https://openreview.net/forum?id=Hk3mPK5gg&noteId=Hk3mPK5gg

Parameters	Description	FlatMap	CIGTrack1
living	Penalize agent who just lives	-0.008 / action	
health_loss	Penalize health decrement	-0.05 / unit	
ammo_loss	Penalize ammunition decrement	-0.04 / unit	
health_pickup	Reward for medkit pickup	0.04 / unit	
ammo_pickup	Reward for ammunition pickup	0.15 / unit	
dist_penalty	Penalize the agent when it stays	-0.03 / action	
dist_reward	Reward the agent when it moves	9e-5 / unit distance

### Outline

What is RL? (Three steps in ML)

Policy Gradient

**Actor-Critic** 

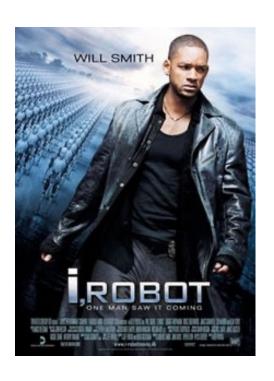

**Reward Shaping** 

No Reward: Learning from Demonstration

#### Motivation

- Even define reward can be challenging in some tasks.
- Hand-crafted rewards can lead to uncontrolled behavior.

#### Three Laws of Robotics:

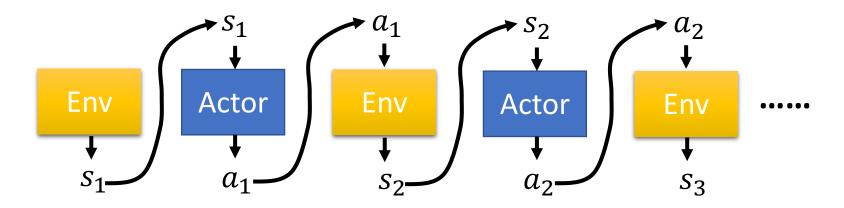

- 1. A robot may not injure a human being or, through inaction, allow a human being to come to harm.
- 2. A robot must obey the orders given it by human beings except where such orders would conflict with the First Law.
- 3. A robot must protect its own existence as long as such protection does not conflict with the First or Second Laws.

restraining individual human behavior and sacrificing some humans will ensure humanity's survival

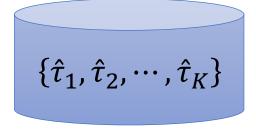

### Imitation Learning

Actor can interact with the environment, but reward function is not available

We have demonstration of the expert.

Each  $\hat{\tau}$  is a trajectory of the export.

Self driving: record human drivers

Robot: grab the arm of robot

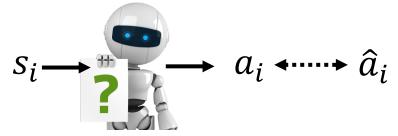

### Isn't it Supervised Learning?

Self-driving cars as example

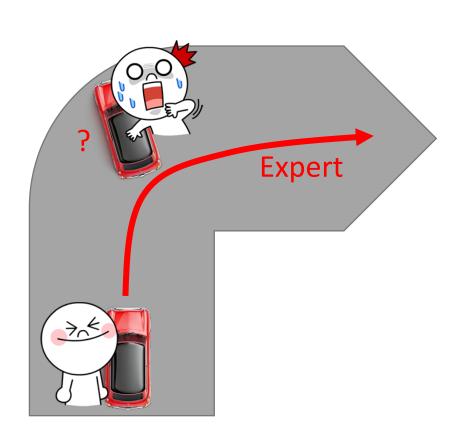

forward

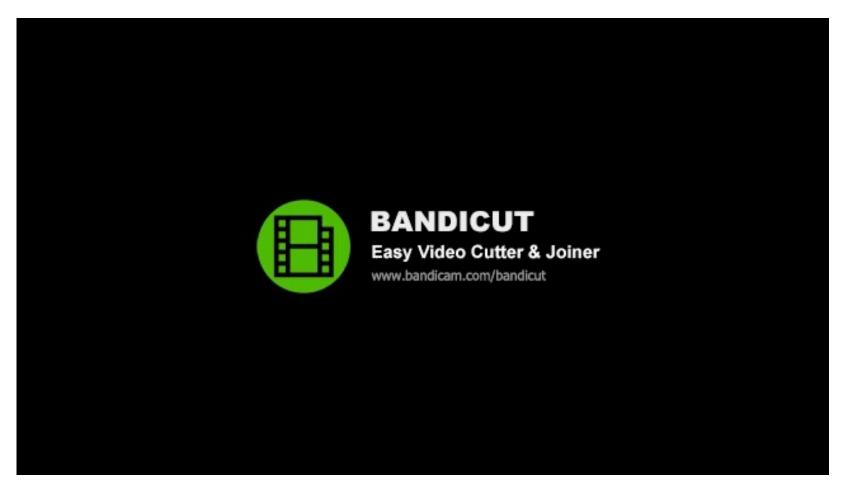

Problem: The experts only sample limited observation. Yes, also known as **Behavior Cloning** 

### More problem .....

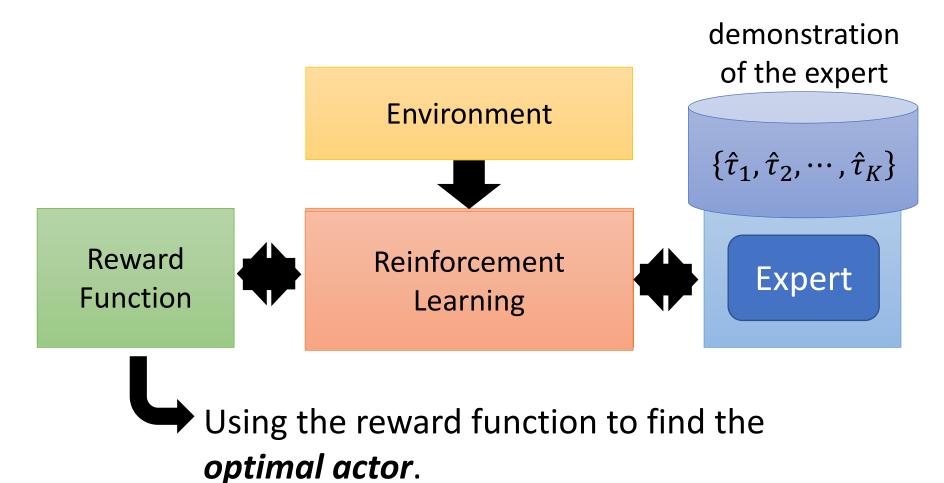

The agent will coperate every behavior, even irrelevant actions.

https://www.youtube.com/watch?v=j2FSB3bseek

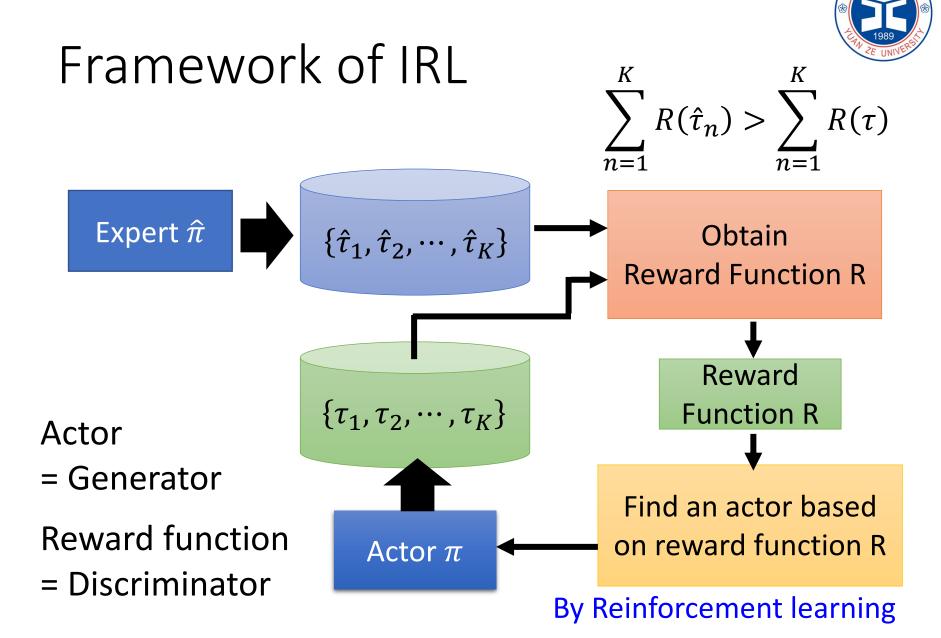

### Inverse Reinforcement Learning

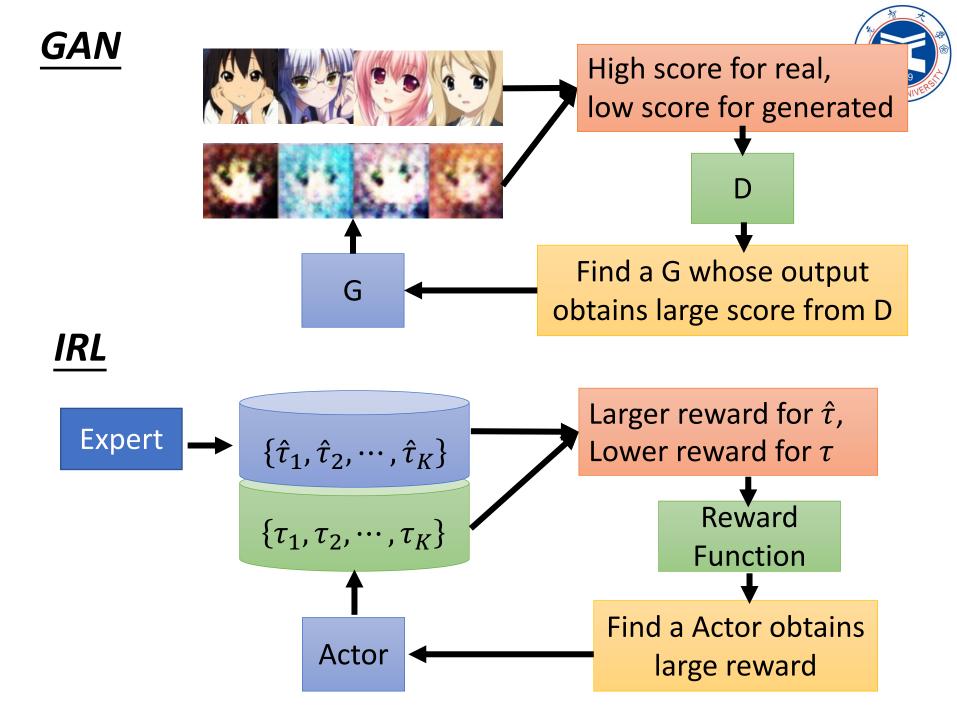

### Inverse Reinforcement Learning

- Principle: The teacher is always the best.
- Basic idea:
  - Initialize an actor
  - In each iteration
    - The actor interacts with the environments to obtain some trajectories.
    - Define a reward function, which makes the trajectories of the teacher better than the actor.
    - The actor learns to maximize the reward based on the new reward function.
  - Output the reward function and the actor learned from the reward function

### Robot
